

PROJECT MANAGEMENT

- This course will covers concepts and skills that are used by manager to propose, plan, secure resources, budget, and lead project team to successful completions of their projects.
- The course will help student to understand the concepts and techniques to manage a project, providing not only a rationale for the use of project management processes, but also why it works, the concepts, principles and techniques are universally applicable.
- This course does not specialize by industry type or project scope, instead, the course will help individual to manage a variety projects, a few of steps of the techniques can be omitted but the conceptual frame-approach can be used.

PROJECT MANAGEMENT

Upon the course, the students will be able to:

1. Learn the stages of project development and how they are implemented.
2. Develop skills in effective time management and planning while determining how deliverables and milestones can have a major impact upon the success of a project. Quality management, effective resource allocation and risk analysis are also determining factors that will be discussed.
3. Learn on the progress and performance measurement and evaluation a project

PROJECT MANAGEMENT

Item	Weightage	Passing Mark	Assessed Learning Outcomes
Group Assignment	20%	50 pts.	Meeting All Learning Outcomes
Group Presentation	10%	50 pts.	Meeting All Learning Outcomes
Quiz (1)	10%	50 pts.	Meeting All Learning Outcomes
Mid-Term Exam	20%	50 pts.	Meeting All Learning Outcomes
Final Exam	30%	50 pts.	Meeting All Learning Outcomes
Attendance	10%	70 pts.	Meeting All Learning Outcomes

Agenda

- 1. What Is a Project?**
- 2. What is Managed?**
- 3. Current Drivers of Project Management**
- 4. Project Governance**
- 5. Case Study – Win Power Project**

1. What is a Project

What is a Project? Definition Major characteristics of a project

A project is a temporary endeavor undertaken to create a unique product or service.

The major characteristics of a project are as follows:

1. An established objective
2. A defined life span with a beginning and an end
3. Usually, the involvement of several departments and professionals
4. Typically, doing something that has never been done before
5. Specific time, cost, and performance requirements

Objective

Schedule

**Across
departments**

1. What is a Project (cont.)

Projects and Routine works

Project is done only once

- Taking class notes
- Daily entering sales receipts into the accounting ledger
- Responding to a supply-chain request
- Practicing scales on the piano

Routine works typically requires doing the same or similar work over and over

- Writing a term paper
- Setting up a sales kiosk for a professional accounting meeting
- Developing a supply-chain information system
- Writing a new piano sheet

1. What is a Project (cont.)

Projects and Program

Each project within a program has a project manager

Projects are parts of overall programs and may be broken down into tasks, subtasks, and further if desired.

- ✓ Program is a group of related projects designed to accomplish a common goal over an extended period of time
- ✓ Program management is the process of managing a group of ongoing, interdependent, related projects in a coordinated way to achieve strategic objectives.

2. What is Managed

2. What is Managed (cont.)

The Project Life Cycle

2. What is Managed (cont.)

S-shaped life path cycle

Traditional PM life cycle
Building a house.
Progress is slow-fast-slow

J-shaped life path cycle

Baking a cake
The development of computer software

3. Current Drivers of Project Management

Project selection

(1) Is the project potentially profitable? Does it have a chance of meeting our return-on-investment hurdle rate?

(4) Does the project involve building competencies that are considered consistent with our firm's strategic plan?

Funding & approval

(2) Is the project required by law or the rules of an industrial association; i.e., a "mandate?"

(5) Does the organization currently have the capacity to carry out the project on its proposed schedule?

(3) Does the firm have, or can it easily acquire, the knowledge and skills to carry out the project successfully?

(6) In the case of R&D projects, if the project is technically successful, does it meet all requirements to make it economically successful?

4. Project Governance

Governance is designed to improve project management in the whole organization over the long haul

4. Project Governance (cont.)

The rationale for integration of project management was to provide senior management with:

- An overview of all project management activities
- A big picture of how organization resources are being used
- An assessment of the risk their portfolio of projects represents
- A rough metric for measuring the improvement of managing projects relative to others in the industry
- Linkages of senior management with actual project execution management

4. Project Governance (cont.)

Comparison of Project Management & General Management

Dimension	Project Management	General Management
Type of work activity	Unique	Routine
Management Approach	Ability to adapt to change	Manage by exception
Planning	Critical	Important
Budgeting	Start from scratch, multiple budget periods	Modify budget from previous budget period
Sequence of Activities	Must be determined	Often predetermined
Location of work	Crosses organizational units	Within an organizational unit
Reporting Relationships	Informal	Well defined

5. Case Study

WIN POWER PROJECT IN VIETNAM

5. Case Study

Assignment 1 INTRODUCTION OF WIN POWER PROJECT IN VIETNAM HOW IT IS POTENTIAL ?

Introduction – VIETNAM WIN POWER DEVELOPMENT

The Government of Vietnam seeks to promote the power development in order to meet the requirements of socio-economic development, ensure the national energy security, and satisfy the daily power needs. The continuous effort of everyone in the electricity sector together with the support from the Government has made a significant improvement in the national power system of Vietnam. Electricity supply is guaranteed to be enough for socio-economic development demands. Its quality and reliability is also enhanced and improved. To date the total installed capacity of the power supply in Vietnam has reached over 37,000 MW with the maximum power load has reached 25,800 MW. The national power system has had backup power sources, though not equally distributed for all regions. In the period from 1995 to 2014, the average growth rate of commercial electricity was always among the highest level regionally and internationally, which is 13.8%/ year while the annual GDP increased by 6.7% on average. In the future, Vietnam electricity sector still faces big challenges. One of them is the lack of primary energy sources for electricity generation leading to the needs for importing coal in the coming years. Another challenge is the requirement for ensuring national energy security to meet the socio-economic development strategy as well as national security and defense. Last but not least, Vietnam has to fulfill its commitment to reduce the greenhouse gas emission and protect the environment; most recently it set the target of greenhouse gas reduction of Vietnam in the COP21 Paris Climate Conference in December 2015. The Prime Minister has issued a number of support mechanisms and policies that prioritize and encourage renewable energy development.

The Renewable Energy Development Strategy until 2030, with the vision towards 2050 approved by the PM in Decision No.2068/ QĐ-TTg dated 25/11/2015 sets out the following objectives:

- Increase the electricity generation from renewable sources from 58 billion kWh in 2015 (which accounts for 35% of the total national electricity generation) to approximately 101 billion kWh in 2020 (38%), 186 billion kWh in 2030 (accounting for 32%) and 452 billion kWh in 2050 (43%).
- The detailed target for wind power is as follow: Wind power generation is expected to increase from 180 million kWh in 2015 to about 2.5 billion kWh in 2020 (accounting for 1% of total power generation), 16 billion kWh in 2030 (2.7%) and 53 billion kWh in 2050 (5.0%).

Driven by rapid economic development, electricity demand in Vietnam has experienced double-digit growth rates during the past decade. In the future, this growth is expected to continue, albeit at single digits. The Revised National Power Development Master Plan VII foresees an electricity installed capacity
