Digital Transformation Tools & Techniques

COMPREHENSIVE EXAM STUDY NOTES

All-in-one notes merged from: CRM Dynamics Intro (PPTX) + Power Platform (PPTX) + Dynamics 365 Sales (DOC) + Customer Insights (DOC) + Service in Dynamics 365 (DOC).
Covers ALL topics for tomorrow's exam.

Course: DTTT | Exam: Tomorrow! | 5 Source Files Merged

MODULE 1 — CRM Systems Overview

1.1 What is CRM?

CRM (Customer Relationship Management) is a system that helps companies manage all interactions with their customers — from finding them, selling to them, and supporting them after purchase. All data is shared and connected across all apps.

Popular CRM Systems

Salesforce, HubSpot, Zoho, Pipedrive, SugarCRM, Zendesk, Microsoft Dynamics 365, NetSuite, Streak, Oracle CRM, Freshworks, ActiveCampaign, Odoo, ClickUp, Keap, Insightly, Nutshell, Apptivo, BIGContacts, Mailchimp, Capsule, Creatio.

□ NOTE: Microsoft Dynamics 365 is Microsoft's flagship CRM — it combines CRM and ERP into one unified cloud platform.

1.2 How D365 CRM Apps Work Together

All apps share the same customer data. This means no duplicate data, everyone sees the same customer info, and work becomes faster and smarter.

Full Customer Journey — Step by Step

Phase	Tool Used	What Happens
1. Marketing	Customer Insights – Journeys	Company sends emails/ads. People interact (click, sign up). Interest is tracked.
2. Sales	Dynamics 365 Sales	Interest becomes a lead. Salesperson contacts. If serious → Opportunity → Quote → Deal closed.
3. Customer Service	Customer Service	If customer has issue → support team helps. Case created and resolved.
4. Field Service	Field Service	Technician sent for installation or on-site repair.
5. Insights / Analytics	Customer Insights – Data	Collects ALL data, finds patterns, helps understand customers, suggests discounts/offers.

□ EXAM TIP: One-liner: D365 apps work together to manage the FULL customer journey in one system — Marketing → Sales → Service → Field Service → Insights.

1.3 D365 App Modules (Full List)

D365 Sales	Manage leads, opportunities, quotes, orders, invoices — full sales lifecycle
D365 Marketing / Customer Insights – Journeys	Email campaigns, customer journeys, lead scoring, event management
D365 Customer Service	Case management, SLAs, knowledge base, queues, entitlements
D365 Field Service	On-site service, work orders, schedule board, technician dispatch
D365 Customer Insights – Data	360-degree customer profiles, segments, measures, predictions
D365 Project Operations	Project sales, delivery, resource management, billing
D365 Business Central	All-in-one ERP for SMBs
D365 Finance & Operations	Finance, SCM, HR, manufacturing for large enterprises

1.4 Accessing D365 Apps — 3 Ways

Web Browser	office.com → Apps → Business Apps → click app (most common for daily users)
Mobile Apps	Sales or Field Service on phone — useful for salespeople and technicians working outside
Power Pages (for customers)	Customers log in, check cases, read help articles — external portal

1.5 D365 Interface — Key Elements

App Switcher	Change from one app to another (e.g., Sales → Customer Service)
Sitemap (Left Menu)	Shows all sections (Accounts, Leads, Orders) — can expand/collapse
Recent & Pinned	Recent = recently opened records. Pinned = important saved records.
Work Area (Main Screen)	Where you actually work (data, forms, lists)
Area Switcher	Switch between sections like Sales area or Settings area
Views	List of records — can sort, filter, search, select multiple rows
Forms	Full details of ONE record — organized in Tabs. Related connected data shown.
Timeline	History of ALL activities (emails, calls, meetings, notes) in one place
Copilot	AI helper — ask questions, summarize records, draft emails

MODULE 2 — Microsoft Dynamics 365 Sales

2.1 What is D365 Sales?

Dynamics 365 Sales is a smart digital notebook for salespeople. It helps them remember customers, track deals, follow sales steps, and sell faster. Instead of writing sales info on paper, everything is stored in a smart system.

□ EXAM TIP: Sales flow to memorize: Lead → Opportunity → Quote → Order → Invoice

Lead	Opportunity	Quote	Order	Invoice
------	-------------	-------	-------	---------

2.2 Sales Lifecycle — Each Step Explained

Lead	A possible customer. Someone who shows interest (visits website, fills form, calls). NOT sure yet if they will buy.
Opportunity	Serious buyer — customer says 'I want to buy'. Now it's a real sales chance.
Quote	Formal price offer given to customer. E.g., 'Laptop = \$1000'
Order	Customer agrees to buy — confirmed purchase request.
Invoice	Bill sent to customer for payment — final step.

□ KEY POINT: Real-life example: You go to a mobile shop → Lead (enter shop) → Opportunity (ask price) → Quote (price given) → Order (agree to buy) → Invoice (you pay).

2.3 Lead Management

What is a Lead?

A lead is a POSSIBLE customer. Someone who visits website, calls, leaves a business card, or shows interest in a product. We are NOT sure yet if they will buy.

Lead Qualification Process

1. Capture or create the lead (from website forms, emails, trade shows, imported lists).
2. Research the lead — company size, industry, budget, needs.
3. Contact the lead — phone call, meeting, or email.
4. Gather important info — stakeholders (who decides), budget, competitors, timeline.
5. Track everything in system — Timeline shows all activities, Assistant gives reminders.
6. Decision time: Qualified (→ move to Opportunity) or Disqualified (→ stop following).

Qualified Lead	Real customer — needs product, can afford it, is serious. Move to Opportunity.
Disqualified Lead	Not interested, not suitable, or can't afford it. Stop pursuing.

2.4 Opportunity Management

An opportunity is a **SERIOUS** potential customer who is likely to buy. A lead becomes an opportunity when they say 'I want to buy'.

Opportunity Process

7. Create opportunity — record what customer wants, estimated price, and timeline.
8. Talk with customer — calls, meetings, understand needs.
9. Collect details — who decides (stakeholders), budget, competitors.
10. Track progress — system shows calls, meetings, reminders.
11. Move stages — Develop → Propose → Close.

Business Process Flow (BPF) — 4 Stages

Qualify	Develop	Propose	Close
Qualify	Check if customer is real — do they need it? Can they afford it?		
Develop	Understand needs in depth — calls, meetings, research.		
Propose	Give price (Quote) — formal offer.		
Close	Customer agrees — move to Order → Invoice → Payment.		

2.5 Product Catalog

A product catalog is a list of everything a company sells (including prices). Think of it as the company's shopping menu.

Unit Groups	How a product is sold — 1 laptop = 1 unit, 1 service = 1 hour, 1 box = 12 items.
Products	Actual items or services sold — Laptop, Coffee machine, Haircut service.
Price Lists	Different prices for different customers — Retail: \$100, Government: \$90, Seasonal: \$80.
Discount Lists	Price changes based on quantity — Buy 1 TV: \$300, Buy 500: \$250 each.

❑ **KEY POINT:** Used across: Sales (Quotes, Orders, Invoices), Field Service (repair services), Customer Service (link products to issues), Marketing (promotions), Projects (pricing).

2.6 Sales Accelerator

Sales Accelerator is like a smart to-do list for salespeople. It tells them exactly what to do next instead of guessing.

Work List	Prioritized task list showing who to call, email, and which deal is most important — like a Netflix list but for sales.
Sequences	Step-by-step guide for selling: Call customer → Send email → Schedule meeting → Follow up. Ensures nothing is forgotten.
Sequence Analytics	Shows what is working, what isn't, and where deals are stuck.
SMS Feature	Send messages to customers and see chat history in system — no app switching needed.

2.7 Copilot in D365 Sales

Copilot is an AI helper inside Dynamics 365 Sales. It helps salespeople work faster using AI.

Summarize Records	Gives short summary of leads and opportunities instead of reading long data.
Recent Changes	Shows what changed in customer data.
Meeting Help	Prepares you for meetings: customer info, past activity, notes.
Email Help	Helps write emails, reply faster, summarize email chats.
Product Suggestions	Suggests products based on customer needs.
Find Documents	Searches sales files (like SharePoint) automatically.

2.8 Sales Qualification Agent (AI)

An AI that automatically checks if a lead is good or bad — instead of the salesperson doing all research manually.

- Checks background — who is the customer, what company they work for.
- Provides insights — is it a good match? Do they have buying interest?
- Shows news — latest updates about the company and industry.
- Validates email — is it valid? Work email or personal?
- Shows result — 'Good lead' or 'Not good lead' with suggested email.

2.9 Sales Insights (AI Analytics)

Dynamics 365 Sales Insights is an AI-powered tool that helps salespeople understand customers better, build strong relationships, and close deals faster.

Assistant	Smart reminder system — shows important alerts, reminds tasks, suggests next action. You never miss anything.
Email Engagement	Tracks what customer does with emails — opened, replied, or ignored. If customer opens 5 times → call them!
Auto Capture	Automatically saves emails and activities into system without manual entry.
Relationship Analytics	Shows relationship health — green = good, red = weak. Fix weak relationships before losing customer.
Predictive Lead Scoring	AI gives score to leads — Lead A: 90 (very good), Lead B: 30 (not good). Focus on high scores.
Predictive Opportunity Scoring	AI predicts deal success — 'This deal has 80% chance to close'.
Notes Analysis	AI reads your notes and gives suggestions — 'Customer says price is high' → AI suggests 'Offer discount'.
Who Knows Whom	Shows connections — your colleague already knows this customer → ask for introduction.
Premium Forecasting	Advanced sales prediction using AI + past data + current deals.

2.10 Sales Forecasting & Pipeline

Sales Pipeline	All ongoing deals — customers moving through stages: New lead → Talking → Negotiation → Closing.
Sales Forecasting	Predicting future sales — system looks at current deals, past sales, opportunities to predict future revenue.
LinkedIn Sales Insights	Uses LinkedIn data — customer job info, company details, mutual connections for easier contact.
Sales Mobile App	Access data anywhere, update deals on phone, call/email customers — work while traveling.
Microsoft 365 Copilot for Sales	Writes emails, saves meeting notes, syncs from Outlook & Teams, reduces manual work.

MODULE 3 — Dynamics 365 Customer Insights – Journeys (Marketing)

3.1 What is Customer Insights – Journeys?

A smart marketing assistant for a company. It helps businesses find customers, talk to them, understand them, and turn them into buyers. This is the **MARKETING** tool of D365.

□ **KEY POINT:** Simple Example: You have an online shop → Someone visits → Tool tracks it → You send email with discount → They click → Tool sends more offers → Everything automated. This whole process = Customer Journey.

3.2 Key Features at a Glance

Lead Generation & Scoring	Find new customers (leads) and give them a score based on interest level. High score = serious buyer.
Drag & Drop Tools	No coding needed — drag and drop to create emails, marketing pages, campaigns.
Automated Customer Journeys	Create automatic steps: User signs up → welcome email → wait 2 days → discount offer. System does everything.
Email Marketing	Send personalized emails: 'Hi Ali, 20% discount for you!'
Customer Segmentation	Divide customers into groups (students, professionals, frequent buyers) and send different messages to each.
Better Decision Making	Shows data and reports — what works and what doesn't.
Event Management	Manage webinars and workshops — send invites, track who joins.
Copilot (AI)	Write emails, suggest ideas, save time — like ChatGPT helping marketers.

3.3 Real-Time Marketing — VERY IMPORTANT

Real-Time Marketing means the system responds **INSTANTLY** when a customer does something.

□ **KEY POINT:** Example 1: Customer connects to café Wi-Fi → immediately send '10% discount' offer. Example 2: Customer visits website → instantly send notification.

Benefits of Real-Time Marketing

- Engage instantly — talk to customer at the right moment.
- Build loyalty faster — customer feels valued.

- AI personalization — system suggests best message.
- Works across all platforms — Email + SMS + app notifications.

□ EXAM TIP: ALWAYS REMEMBER — 3 Things: WHO (Audience/Segment) + WHAT (Content/Email) + WHEN (Timing/Trigger)

3.4 Customer Journey — How It Works

Customer Journey = steps a customer follows from interest to buying. Goal: convert customer into revenue.

Send Email	Customer Clicks	Show Product	Show Interest	Send More Info	Sales Contacts	Customer Buys
------------	-----------------	--------------	---------------	----------------	----------------	---------------

Types of Triggers

Custom Trigger	Created by user — 'User filled form', 'Button clicked'
Interaction Trigger	Customer actions — email opened, link clicked, form submitted
Business Trigger	System events — new customer created, address updated

□ NOTE: Minimum to create a journey: 1) Segment (WHO) + 2) Marketing Activity (WHAT email/message)

3.5 Email Marketing in D365

Send Many Emails	Send emails to thousands of people quickly for product launches or promotions.
Personalization	'Hi Ali' instead of 'Hi Customer' — each email customized. Makes customer feel special.
Track Activity	System tracks: Who opened email, who clicked links. High opens = high interest → call them.
Works with Journeys	Emails are part of automated process — User signs up → welcome email → 2 days → offer.
Reports & Analytics	Shows open rate, click rate — helps improve marketing.

Subscription & Consent (IMPORTANT)

- Customers MUST give permission before receiving emails.
- Subscription Topics: Newsletter, Events, Discounts — customers choose what they want.
- Explicit Consent: User clearly agrees with checkbox.
- Implicit Consent: Permission taken silently (hidden fields). Legal requirement to avoid spam.

Email Designer

Drag & Drop — no coding. Add text, images, colors, links, buttons. Dynamic Content = email changes based on user (show different products to different users).

3.6 Segments — Targeting the Right Customers

Segment = group of similar customers. Examples: People living in Karachi, customers who attended an event, high-income customers.

Static Segment	Created once, doesn't change automatically. E.g., People who attended a specific event.
Dynamic Segment	Updates automatically — 'Customers who spent \$500 in last 3 months' → new people auto-added.
Marketing List	Simple manual list — you add people yourself. E.g., List of 100 customers.

□ KEY POINT: AI Copilot: Just type 'Customers who bought shoes last month' → System creates segment automatically!

3.7 Lead Generation & Qualification in Marketing

Lead Generation	Get leads from website, emails, events, forms. User signs up → becomes lead.
Lead Nurturing	Build relationship slowly — send emails, share offers, give information.
Lead Scoring	Give points: Open email = +5, Click link = +10, Join webinar = +15. Score 100+ → Sales Ready!
Lead Qualification	High score → send to sales team. Low score → nurture more or ignore.
Lead Insights	Full history: emails opened, links clicked, events attended. Used by marketing AND sales.

3.8 Event Management

Plan, organize, and run complete events (webinars, seminars) from start to finish in one system.

Plan & Budget	Promote	Registration	Execute	Analytics	Generate Leads
Event Designer	Create event — choose type, audience, goals.				
Event Logistics	Manage location, fees, details.				
Agenda & Sessions	Plan schedule — 10 AM Introduction, 11 AM Product demo.				
Speakers & Sponsors	Manage speakers, sponsors, and costs.				

Registration Management	Create tickets/passes. Manage attendees.
Drive Sales	Use attendee data for follow-up marketing and offers.

□ NOTE: Teams Webinar Integration: Microsoft Teams is now incorporated directly into Marketing for hosting live events and interactive online meetings.

3.9 Account-Based Marketing

Account-Based Journeys	Generate account leads, trigger decisions at account level, assign activities related to accounts.
Account-Based Personalization	Design email content that displays info from and reacts to the account record.
Account Insights	Results and KPIs reflecting interactions made by all contacts belonging to the account.
Account-Based Lead Scoring	Score each lead to reflect activities of all contacts that belong to an account.

3.10 Types of Data in Marketing

Behavioral Data	Generated automatically from contact interactions — opening emails, clicking links, submitting forms, registering for events.
Profile Data	Information captured and stored on entities — leads, accounts, contacts.

MODULE 4 — Dynamics 365 Customer Insights – Data

4.1 What is Customer Insights – Data?

A tool that collects ALL customer data from everywhere (website, app, store, social media) and combines it into ONE complete view of each customer. This is the BRAIN of the system.

□ KEY POINT: 360-Degree View = Full information about a customer in ONE place: Name, Purchases, Website visits, Interests — all together.

4.2 Types of Data Used

Transactional Data	What customer buys — 'Bought shoes on Monday'
Behavioral Data	What customer does — clicked website, opened email, viewed product
Demographic Data	Who customer is — age, location, income, interests

4.3 Core Capabilities — COLLECT → COMBINE → UNDERSTAND → GROUP → USE

Collect Data	Create Profile	Show Activity	Enrichment	Measure KPIs	Make Segments	Use Everywhere
--------------	----------------	---------------	------------	--------------	---------------	----------------

1. Collect Data (Ingestion)	Take data from everywhere — website visits, purchases, emails, apps.
2. Unified Customer Profile	Combine ALL data of ONE person into one place. Ali: bought shoes + visited website + opened email → ONE profile.
3. Activity Timeline	Show what customer did — bought product, clicked link, viewed page. Easy to understand behavior.
4. Enrichment	Add extra details — interests, favorite brands, hobbies. Enhances profile quality.
5. Measures (KPIs)	Check performance — total sales, customer spending, number of visits.
6. Segments	Group customers — 'people who buy shoes', 'frequent buyers', 'new customers'.
7. Use Everywhere	Send data to other apps — marketing, sales, Power Apps, Power BI, automation.

4.4 Unified Customer Profile — Deep Dive

Definition: All data of ONE customer in ONE place. Think: Digital Twin = virtual copy of a customer.

How Unified Profile is Built

Collect Data	Match Same Customer	Merge Data	Create Profile
--------------	---------------------	------------	----------------

System handles: duplicate records (same person twice), matching rules (same email = same person), final merging of all data.

4.5 Measures, Segments & Predictions

□ EXAM TIP: MEMORY TRICK: Measures = Numbers | Segments = Groups | Predictions = Future (AI guess)

Measures	Important numbers: total sales, customer spending, visit count. Shows business performance.
Static Segment	Created once, doesn't change. E.g., People who attended ONE specific event.
Dynamic Segment	Updates automatically. E.g., 'Customers who spent \$500 in last 3 months' → auto-updated.
Customer Lifetime Value (Prediction)	AI predicts how much money a customer will spend in future.
Product Recommendation (Prediction)	AI suggests what customer will buy next.
Churn Prediction	AI predicts who might STOP buying — so you can retain them.
Sentiment Analysis (Prediction)	AI detects if customer is happy or unhappy.

4.6 Consuming Customer Insights Data

'Consuming' means using customer data in other apps to take real actions. Customer Insights collects and analyzes — other apps ACT on it.

Data Export	Send full customer details (name, email, purchase history) to other systems.
Segments Export	Send customer groups ('High spenders', 'New customers') to marketing tools.
Marketing Tools	Send emails, run ads — 'High spenders get 50% discount email'.
Sales System	Sales team sees customer info — 'Customer bought 3 times → offer upgrade'.

Power Apps	Build simple apps using customer data — shop staff sees profile on screen.
Power Automate	Automatic actions — 'If customer inactive → send email automatically'.
Power BI	Show charts and insights — 'Which customers spend most money?'

4.7 Copilot in Customer Insights – Data

Copilot = AI assistant you can talk to in normal English. Instead of complex queries, just ask questions.

Answer Customer Questions	Ask: 'How many customers spent \$1000+ in last 6 months?' → Copilot checks data and answers.
Create Segments	Type: 'Customers living in Seattle' → Copilot creates segment automatically.
Complex Segments	Type: 'Customers who spent \$500 AND bought in last 30 days' → Copilot builds it.
Explain Features	Act as teacher — ask 'What is segmentation?' and it explains using official Microsoft docs.

MODULE 5 — Service in Dynamics 365

5.1 Customer Service Core Concepts

Customer	A company, organization, or person that service is performed for.
Case	Fundamental record type — represents a SINGLE incident or service request.
Activity	Interactions between a business and its customers (calls, emails, meetings).
Entitlement	The amount of support a customer is entitled to — aka a support contract.
Service Level Agreement (SLA)	The level of service agreed with a customer — KPIs: First Response By, Resolve By.
Knowledge Base	Repository of knowledge articles to help resolve cases quickly.
Queue	Way to manage workload — cases and activities are placed in queues.
Assets	Items at a customer location that service is provided for.
Service	Specifies the resources required to perform a service for a customer.

5.2 Case Management — End-to-End

Typical Customer Support Journey

Customer Contacts	Virtual Agent Tries	Escalate to Human	Case Created	AI Intent Analysis	SLA Applied	Agent Resolves	Follow-up	Article Created
-------------------	---------------------	-------------------	--------------	--------------------	-------------	----------------	-----------	-----------------

Case Creation — Automatic

Cases can be created automatically from email, chat, phone, or web forms. The system routes them to the right queue based on rules.

Case Hierarchies — Parent / Child Cases

None	Closing the parent case has NO effect on child cases. Child cases must be closed individually.
Close All Child Cases	Any open child cases are AUTOMATICALLY closed when the parent case is closed.
Don't Allow Parent Closure	All child cases MUST be closed BEFORE the parent case can be closed.

Case Merging

Multiple cases from the same customer about the same issue can be merged into one MASTER case. Prevents duplicate work.

5.3 Queues & Routing

Queues manage the workload for cases and activities. Cases are placed in queues and assigned to agents based on routing rules.

Basic vs Unified Routing

Basic Routing	Simple rules — Gold customer → Gold team, Billing issue → Billing team.
Skills-Based (Unified)	Route to the expert agent — Technical issue → tech expert.
Shift-Based (Unified)	Route to agent who is currently working their shift.
Capacity-Based (Unified)	Route to agent who is currently free / has capacity.
Intent-Based / AI (Unified)	AI understands problem type and routes automatically.

5.4 Entitlements & SLAs

Entitlement	Support contract — defines how much support a customer receives (e.g., 10 hours of phone support per year).
SLA — First Response By	Time limit for agent to first respond to case.
SLA — Resolve By	Time limit for case to be fully resolved.
SLA KPIs	Track compliance — are we meeting our commitments to customers?

5.5 Knowledge Management

Knowledge articles are help guides — FAQs, step-by-step instructions, troubleshooting guides. They are used in the portal, chatbot, and by support agents.

3 Ways to Create Knowledge Articles

Manual (Human)	Person writes the article manually — best quality but takes time.
Semi-Automatic	When agent solves a case, system asks 'Create article from this case?' — saves time, uses real data.
Automatic (AI)	AI checks cases, finds repeated problems, creates articles automatically — fast and smart.

Knowledge Article Lifecycle

Draft	Review	Approved	Published	Expired
-------	--------	----------	-----------	---------

5.6 Dynamics 365 Contact Center

A system used by companies to handle customer support from different channels (Chat, Phone, SMS, Social media). Goal: give fast, smooth, and same-quality support everywhere.

Omnichannel Support

- Chat — website chat box
- Voice — phone calls, can include IVR (press 1, press 2)
- SMS — text messages
- Social Media — WhatsApp, Facebook, LINE
- Microsoft Teams — business communication

AI Features in Contact Center

Case Management Agent (AI)	Creates case automatically, follows up, can close case.
Intent Agent	Understands customer problem — 'Coffee machine not turning on' → detects 'Technical Issue'.
Knowledge Agent	Creates help articles automatically from resolved cases.
AI Summary	Shows customer problem quickly with what has already been tried.
Sentiment Analysis	Detects customer mood (angry/happy) — helps agent respond better.

Workstream Concept

A workstream is like a route manager. It decides: Where message goes + which agent gets it. Includes: 1) Classification (what type of issue?) 2) Routing (who should handle it?) 3) AI Agent tries first before human.

5.7 Self-Service Capabilities

Self-service = customers solve their OWN problems without calling support. Saves money, faster, customers are happier.

Knowledge Articles	Simple help guides — FAQs, step-by-step instructions. Customer solves problem → no need to call.
Self-Service Portal	Website for customers — check cases, track status, read articles, do things themselves.
Virtual Agents (Chatbots)	AI bots that answer questions, guide steps, send links, transfer to human if needed.

5.8 Workforce Management (WFM)

WFM = managing employees (agents) so the right people are available at the right time. Too many customers = long wait. Too many agents = waste of money. WFM balances both.

Forecasting	Predict future workload — Long-term (up to 6 months) and Short-term (15-minute intervals, up to 6 weeks).
Capacity Planning	Convert forecast into number of agents needed. Key terms: Service Level, Shrinkage, Concurrency.
Scheduling	Create agent shifts — Manual (manager assigns) or Automatic (system assigns).
Intraday Management	Real-time adjustment — suddenly more calls → add more agents instantly.
Adherence Tracking	Check if agents follow their schedule.
Reporting & Analytics	Analyze performance: AHT, SLA compliance, CSAT, queue wait times.

□ EXAM TIP: WFM Key Terms: Service Level = % of calls answered on time (e.g., 80% in 60 sec). Shrinkage = time agents NOT working (breaks, meetings). Concurrency = how many chats one agent handles simultaneously.

5.9 Microsoft 365 Copilot for Service

AI assistant for customer service that works inside Outlook, Teams, and CRM systems (Dynamics 365, Salesforce, ServiceNow).

Case Summary	Quickly understand customer issue without reading everything.
Email Summary	Summarize long email threads instantly.
Draft Replies	Automatically write email responses.
CRM Integration	View customer data directly in Outlook and Teams.
Edit & Improve	Modify AI-generated content before sending.
Track Data Source	See where AI got the information from.

□ KEY POINT: Simple Example: Customer emails 'My order is delayed' → Copilot: Summarizes issue, shows customer history, suggests reply → Agent sends quickly.

MODULE 6 — Dynamics 365 Field Service

6.1 What is Field Service?

Field Service = work done at customer location. Technician comes to you instead of you going to the shop. The goal is to deliver service at customer locations efficiently.

Use Cases

- Manufacturing — Machine repair on-site
- Utilities — Internet outage technician visit
- Healthcare — Home visits
- Maintenance — Equipment repair

Key Benefits

- Complete more service calls per technician per week
- Reduce travel time, mileage, and vehicle wear
- Improve first-time fix rate
- Keep customers updated with real-time notifications

6.2 Primary Field Service Flow

Work Order Generated	Schedule & Dispatch	Service Delivery	Review & Bill
----------------------	---------------------	------------------	---------------

6.3 Work Orders — VERY IMPORTANT

A work order = a job/task to be done. Customer has a problem → Work Order is created.

Work Order Lifecycle

Create	Schedule	Dispatch	Service	Review	Invoice
--------	----------	----------	---------	--------	---------

Work Order Status

Open (Unscheduled)	Work order created, no technician assigned yet.
Open (Scheduled)	Technician assigned and scheduled.
In Progress	Technician is actively working on it.
Completed	Work is done.
Closed	Reviewed, invoiced, and closed.

6.4 Incident Types

Predefined templates for common problems. E.g., 'Coffee machine not heating' already includes: Tasks, Steps, Required tools. Saves time and standardizes work.

6.5 Scheduling in Field Service

Assign the RIGHT technician to each job. Key questions: Who is available? Who has required skills? Where is the job? When should it be done?

Manual (Schedule Board)	Drag & drop jobs onto technicians. Dispatcher has full control.
Schedule Assistant	Suggests best technician automatically based on skills, location, availability.
Automated Scheduling (Scheduling Operations Agent)	AI creates optimized schedule — considers skills, location, time, priority. Minimizes travel, maximizes efficiency.

Schedule Board

Main dashboard for dispatchers. Shows available technicians, jobs, map view, time slots. Actions: Rebook, Replace technician, Move jobs.

6.6 Field Service Mobile App

App used by technicians on their phone. Works offline!

- View work orders and daily schedule
- See customer details and location
- GPS navigation to job site
- Copilot in Mobile: Summarize work order, voice updates, auto-fill data
- Works offline — no internet needed on-site

MODULE 7 — Microsoft Power Platform

7.1 What is Power Platform?

The low-code platform that spans Office 365, Azure, Dynamics 365, and standalone applications. Innovation anywhere. Unlocks value everywhere. Makes it easy for anyone familiar with Microsoft Office to create custom business solutions.

3 Key Actions on Data

- Gain Insights (Analyze) — Power BI
- Drive Intelligent Business Processes (Act) — Power Apps
- Automate Business Processes (Automate) — Power Automate

7.2 The 4 Main Components

Power BI (Business Analytics)	Connect to all data, get consolidated view, create dashboards and interactive reports, infuse insights into apps.
Power Apps (App Development)	Build highly customized canvas apps from multiple data sources. Generate model-driven apps from data model. Consume on web and mobile.
Power Automate (Process Automation)	Automate business processes — from simple automations to complex branches/loops. Trigger actions, grant approvals, send notifications.
Power Virtual Agents (Chatbots)	Build powerful virtual agents using no-code graphical interface — no data scientists needed. Bot takes action on customer's behalf.

AI Builder	Add AI capabilities without coding — custom AI models or prebuilt models. Point-and-click AI.
Microsoft Dataverse	Scalable data service — store and manage data from multiple sources. Foundation of Power Platform.
Portals	Enable external access — build responsive websites for internal and external users to interact with Dataverse data.
Data Connectors	275+ connectors — Salesforce, Office 365, Twitter, Dropbox, Google services, SQL Server, SharePoint, and more.

7.3 Power Apps — Deep Dive

3 Types of Apps

App Type	Description	Key Feature
----------	-------------	-------------

Canvas Apps	User experience focused, task or role-based, leverages mash-up data from multiple sources.	Customized UI, multiple connectors, device interaction
Model-Driven Apps	Leverages organization's data model, relationships, and business processes. Built on Dataverse.	Responsive UI, data relationship navigation, security trimming
Portal Apps	Provides secure data access to internal and external stakeholders. External-facing website.	External customer/partner access, Dataverse integration

Power Apps Building Blocks

Power Apps Home Page	Apps start here — build from data, sample app, or blank screen. All your apps appear here.
Power Apps Studio	Develop apps further — Left pane (controls/screens), Middle pane (canvas), Right pane (layout, properties, data).
Power Apps Mobile	Run apps on Windows, iOS, and Android. Download once, log in, see all shared apps.
Power Apps Admin Center	Centralized management — define environments, data connections, roles, data policies.

7.4 Data Connectors — Deep Dive

2 Types of Data Sources

Tabular Data	Returns data in structured table format. Power Apps can read, display, create, edit, delete. Examples: Dataverse, SharePoint, SQL Server.
Function-Based Data	Uses functions to interact — more extensive actions like sending email, updating permissions. Examples: Office 365 Users, Azure Blob Storage.

2 Types of Connector Operations

Triggers (Power Automate only)	Prompt a flow to begin — time-based (every day at 8am) or action-based (new email received, new row created). Always need a trigger.
Actions (Power Automate & Apps)	Prompted by user or trigger — send email, write new row to data source, create a record.

Custom Connectors

- Used in Power Apps, Power Automate, and Azure Logic Apps.
- Extend your app by calling a publicly available API or custom API hosted in Azure.
- 3 ways to create: Using a blank connector, From an OpenAPI definition, From a Postman collection.

7.5 Microsoft Dataverse — Deep Dive

Dataverse is the common currency that enables ALL components of Power Platform to work together. It's the foundation for consolidation, display, and manipulation of data.

Key Benefits of Dataverse

Simple to Manage	Metadata and data stored in cloud — no need to worry about storage details.
Secure Data	Role-based security — users only see data you grant them access to.
Access Dynamics 365 Data	D365 data is also in Dataverse — quickly build apps using D365 data.
Rich Metadata	Data types and relationships used directly in Power Apps.
Logic & Validation	Define calculated columns, business rules, workflows, and BPFs.
Productivity Tools	Tables available in Excel add-ins — accessible and productive.

□ NOTE: Common Data Model: Over 200+ standard business tables. Makes it easier for you and third parties to build apps. Extend with custom tables and columns for your specific needs.

7.6 Power Platform Integration Map

Office 365 Integration	SharePoint Lists, OneDrive, Excel Online, Office 365 Security, Users/Identity.
Dynamics 365 Integration	Common Data Model, Dataverse, Model-Driven Apps, Portals, Customer Insights, Customer Voice.
Azure Integration	Azure AD, Azure Information Protection, Azure DevOps, Azure App Insights, Azure Data Lake, Azure Logic Apps.
350+ Connectors	Including Salesforce, SAP, Zendesk, Marketo, and hundreds more.

MASTER EXAM CHEAT SHEET — All Key Terms

Quick Reference Glossary

Term	Definition
CRM	Customer Relationship Management — system to manage all customer interactions
Lead	Possible customer — shows interest but not yet confirmed buyer
Opportunity	Serious buyer — ready to buy, real sales chance
Quote	Formal price offer sent to customer
Order	Customer agrees to buy — confirmed purchase
Invoice	Bill for payment — final step of sales process
BPF (Business Process Flow)	Step-by-step guide: Qualify → Develop → Propose → Close
Sales Accelerator	Smart to-do list for salespeople — work list + sequences
Copilot	AI assistant — summarizes, writes emails, suggests actions
Lead Scoring	Points given based on customer actions — high score = sales ready
Product Catalog	List of products, unit groups, price lists, discount lists
Sales Pipeline	All ongoing deals across all stages
Sales Forecasting	Predicting future sales revenue using AI and historical data
Customer Journey	Automated steps guiding customer from interest to purchase
Real-Time Marketing	System responds instantly when customer takes an action
Segment	Group of similar customers — static (fixed) or dynamic (auto-updates)
360-Degree View	Complete customer profile with all data in one place
Unified Customer Profile	All data of ONE customer merged from all sources
Churn Prediction	AI predicts which customers might stop buying
Case	Single incident or service request in Customer Service
Entitlement	Support contract — how much support a customer gets
SLA	Service Level Agreement — First Response By + Resolve By time limits
Knowledge Base	Repository of help articles for resolving cases
Queue	Manages workload — cases placed in queues, assigned to agents
Omnichannel	Support from ALL channels (chat, phone, SMS, social) in ONE system
Workstream	Route manager — decides where message goes and which agent gets it
WFM (Workforce Management)	Managing agents so right people available at right time

Forecasting (WFM)	Predicting future workload — Long-term (6 months) / Short-term (6 weeks)
Shrinkage	Time agents are NOT working — breaks, meetings, training
Work Order	Job/task to be done in Field Service — lifecycle: Create→Schedule→Dispatch→Service→Review→Invoice
Schedule Board	Field Service dispatcher dashboard — shows technicians, jobs, map
Incident Type	Predefined template for common problems — includes tasks, steps, tools
Power Platform	Low-code platform: Power BI + Power Apps + Power Automate + Power Virtual Agents
Power BI	Business analytics — dashboards and interactive reports
Power Apps	App development — Canvas, Model-Driven, Portal apps
Power Automate	Process automation — triggers and actions for workflows
Power Virtual Agents	Chatbot builder — no-code, guided interface
Dataverse	Scalable cloud data service — foundation of Power Platform
AI Builder	Add AI capabilities without coding — prebuilt or custom models
Tabular Data Connector	Returns data in table format (SharePoint, SQL, Dataverse)
Function-Based Connector	Uses functions for interactions (Office 365 Users, Azure Blob)
Trigger	Starts a Power Automate flow — time-based or action-based
Action	Operations performed in flows or apps — send email, create record

□ ALL THE BEST! Key focus areas: D365 App modules & how they connect | Sales flow (Lead→Opportunity→Quote→Order→Invoice) | Lead scoring & qualification | Customer Journey triggers | Real-time marketing (WHO+WHAT+WHEN) | Case hierarchy options | SLA KPIs | WFM terms (Shrinkage, Concurrency, Service Level) | Work Order lifecycle | Power Platform 4 components | Dataverse vs Connectors
