

# Forms

Crucial aspect of any business application

## Users

- Registering
- Logging in
- Making purchases
- Scheduling appointments

## Developers

- Handling form data
- Enforcing validation
- Providing visual feedback
- Data submission

# React Hook Form

## What?

A small library that helps deal with forms in React.

## Why?

- Manage form data
- Submit form data
- Enforce validations
- Provide visual feedback
- React Hook Form provides a simple, scalable, and performant way to manage even the most complex of forms

# Project Setup

## Vite

```
npm create vite@latest rhf-demo
```

- For framework, select React
- For variant, choose TypeScript

```
cd rhf-demo
```

```
npm install
```

```
npm run dev
```

# Project Setup

## CRA

```
npx create-react-app rhf-demo --template typescript
```

```
cd rhf-demo
```

```
npm start
```

# Managing Form State

Every form has a few moving parts that keep changing from the time a user loads the form to the time they submit it

- current value of every field in the form
- whether a field has been interacted with
- whether a field's value has changed
- whether the form is invalid
- whether a field contains errors

form state

## Managing Form State contd.

```
{  
  values: {...}  
  visited: {...}  
  errors: {...}  
  isValid: boolean  
}
```

form state

# Form Validation

React Hook Form supports various HTML validation rules

- required
- minLength & maxLength
- min & max
- pattern
